PROJECT MILESTONE SUMMARY

System Design & Model Selection

Technical Architecture & Integration Strategy

MILESTONE OVERVIEW

This milestone focused on identifying the most suitable models, frameworks, and overall system design for the project. It involved selecting appropriate AI models, defining the architectural flow, and outlining data processing pipelines to ensure scalability and efficiency. The objective was to establish a strong technical foundation that would guide the seamless integration of all subsequent components in the system.

CORE FOCUS AREAS

FOCUS PILLAR	KEY OBJECTIVES & DELIVERABLES
Model Selection	Identify, benchmark, and choose optimal AI models tailored for performance, domain accuracy, and resource constraints.
Architectural Flow	Define end-to-end component interaction, API contracts, and system modularity for scalable deployment.
Data Processing Pipelines	Outline reliable data ingestion, transformation, and storage pipelines designed for efficiency and throughput.
Integration Foundation	Establish standards and interfaces ensuring seamless, predictable integration across all future project phases.
